Department of Management

Master 1 Business/ Financial Management

## Risk Management

### 1. Introduction:

Risk can be defined as the chance of loss or an unfavorable outcome associated with an action. Uncertainty does not know what will happen in the future, the greater the uncertainty, the greater the risk. For an individual, risk management involves optimizing expected returns subject to the risks involved and risk tolerance. Risk is what makes it possible to make a profit. If there was no risk, there would be no return to the ability to successfully manage it. For each decision there is a risk return trade-off. Anytime there is a possibility of loss (risk), there should be an opportunity for profit.

Risk management is the process of identifying, assessing and controlling threats to an organization's capital and earnings. These threats, or risk, could stem from a wide variety of sources, including financial uncertainty, legal liabilities, strategic management errors, accidents and natural disasters. IT security threats and data-related risks, and the risk management strategies to alleviate them have become a top priority for digitized companies. As a result, a risk management plan increasingly includes companies' processes for identifying and controlling threats to its digital assets, including proprietary corporate data, a customer's personally identifiable information and intellectual property.

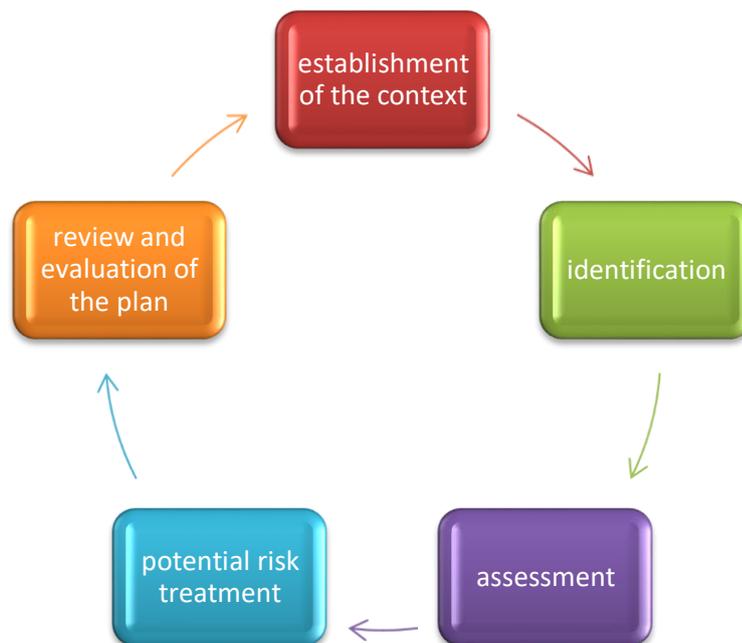

### 2. Definition of Risk Management:

Risk management is an integrated process of delineating (define) specific areas of risk, developing a comprehensive plan, integrating the plan, and conducting the ongoing evaluation' – Dr. P.K. Gupta.

When an entity makes an investment decision, it exposes itself to a number of financial risks. The quantum of such risks depends on the type of financial instrument. These financial risks might be in the form of **high inflation, volatility in capital markets, recession, bankruptcy**, etc. So, in order to minimize and control the exposure of investment to such risks, fund managers and investors practice risk management. Not giving due importance to risk

management while making investment decisions, but risk arises due to change in an economy. Different levels of risk come attached with different categories of asset classes.

### 3. Risk Management Process:

- a. **Establish the Context:** The purpose of this stage of planning enables **to understand the environment** in which the respective organization operates, that means the thoroughly understand the external environment and the internal culture of the organization. You cannot resolve a risk if you do not know that it is. At the initial stage it is necessary to establish the context of risk. To establish the context there is a need to collect relevant data. There is a need to map **the scope of the risks and objectives of the organization**.
- b. **Identification:** After establishing the context, the next step in the process of managing risk is to identify potential risks. Risks are about events that, when triggered, will cause problems. Hence, risk identification can start with the source of problems, or with the problem itself.

Risk identification requires knowledge of the organization, the market in which it operates, the legal, social, economic, political, and climatic environment in which it does its business, its financial strengths and weaknesses, its helplessness to unplanned losses, the manufacturing processes, and the management systems and business mechanism by which it operates.

Any failure at this stage to identify risk may cause a major loss for the organization. Risk identification provides the foundation of risk management. The identification methods are formed by templates or the development of templates for identifying source, problem or event. The various methods of risk identification are – Brainstorming, interview, checklists, structured ‘What-if’ technique (SWIFT), scenario analysis, Fault Tree Analysis (FTA), Bow Tie Analysis, Direct observations, incident analysis, surveys, etc.

- c. **Assessment:** Once risks have been identified, they must then be assessed as to their potential severity of loss and to the probability of occurrence. These quantities can be either simple to measure, in the case of the value of a lost building, or impossible to know for sure in the case of the probability of an unlikely event occurring. Therefore, in the assessment process it is critical to make the best educated guesses possible in order to properly prioritize the implementation of the risk management plan. The fundamental difficulty in risk assessment is determining the rate of occurrence since statistical information is not available on all kind of past incidents.
- d. **Potential Risk Treatments:** Once risks have been identified and assessed, all techniques to manage the risk fall into one or more of these four major categories.

- 
- **Risk Transfer:** Risk transfer means that the expected party transfers whole or part of the losses consequential to risk exposure to another party for a cost. The insurance contracts fundamentally involve risk transfers. Apart from the insurance device, there are certain other techniques by which the risk may be transferred.
  - **Risk Avoidance:** Avoid the risk or the circumstances which may lead to losses in another way, includes not performing an activity that could carry risk. Avoidance may seem the answer to

all risks but avoiding risks also means losing out on the potential gain that accepting (retaining) the risk may have allowed. Not entering a business to avoid the risk of loss also avoids the possibility of earning the profits.

- **Risk Retention:** Risk retention implies that the losses arising due to a risk exposure shall be retained or assumed by the party or the organization. Risk retention is generally a deliberate decision for business organizations inherited with the following characteristics. **Self-insurance and Captive insurance are the two methods of retention.**

A 'captive insurer' is generally defined as an insurance company that is wholly owned and controlled by its insured's; its primary purpose is to insure the risks of its owners, and its insured's benefit from the captive insurer's underwriting profits.

- **Risk Control:** Risk can be controlled wither by avoidance or by controlling losses. Avoidance implies that either a certain loss exposure is not acquired or an existing one is neglected. Loss control can be exercised in two ways – (i) Create the plan and (ii) Risk Control.

#### **i. Create the Plan:**

Decide on the combination of methods to be used for each risk. Each risk management decision should be recorded and approved by the appropriate level of management.

For example, a risk concerning the image of the organization should have top management decision behind it. Whereas, IT management would have the authority to decide on computer virus risks.

The risk management plan should propose applicable and effective security controls for managing the risks. A good risk management plan should contain a schedule for control implementation and responsible persons for those actions. The risk management concept is old but is still not very effectively measured. Example – An observed high risk of computer viruses could be mitigated by acquiring and implementing antivirus software.

#### **ii. Risk Control:**

Once the risk is evaluated, it has to be controlled. In the case of the worker working under the machine that will fall any moment on top of him, risk control implies primarily moving the worker from under there and then fixing the machine so as it does not fall on anyone. Thus the steps involved are immediate directions preventing the risk and isolating or better removing the hazard to eliminate the risk.

Avoiding the risk is the decision of either proceeding in the planned direction or opts for an alternate route which has less risk and is in line with the final objective. Reducing the risk occurrence probability or impact of its consequences or both can be considered while facing a risk. Transferring the risk is another option, mostly done through buying insurance. Other

ways include lease agreements waivers, disclaimers, tickets, and warning signs. Retaining the risk can be another strategy where one knows that it is an inherent part of the event.

After the control measures are implemented it has to be documented. This has multiple benefits such as understanding what was done to tackle a risk thereby allowing similar risks to be tackled in that fashion, to prove that sufficient measures were taken to minimize and eliminate risks and due diligence were exercised etc.

- e. **Review and evaluation of the plan:** Initial risk management plans will never be perfect. Practice, experience and actual loss results, will necessitate changes in the plan and contribute information to allow possible different decisions to be made in dealing with the risk being faced. Risk analysis results and management plans should be updated periodically. There are two primary reasons for this
- To evaluate whether the previously selected security controls are still applicable and effective
  - To evaluate the possible risk level changes in the business movement.

There are risks that do not change and are static in nature. However, other dynamic risks of not continually monitored and reviewed may grow like a bubble and their financial, legal and ethical impacts soon get out of control.

#### 4. **Risk Management Approaches and Methods:**

If you are a business leader, then you already know the importance of risk control. It is imperative that your business has a formal policy to limit the loss of assets and income. Here are the 6 techniques associated with risk management.

- a. **Avoidance:** Avoidance is the best means of loss control. This is because, as the name implies, you are avoiding the risk completely. If your efforts at avoiding the loss have been successful, then there is a 0% probability that you will suffer a loss. This is why avoidance is generally the first of the risk management techniques that is considered. It is a means of completely eliminating a threat.
- b. **Loss Prevention:** Loss prevention is a technique that limits, rather than eliminates, loss instead of avoiding a risk completely, this technique accepts a risk but attempts to minimize the loss as a result of it. For example, storing inventory in a warehouse means that it is susceptible to theft. However, since there really is no way to avoid it, a loss prevention program is put in place to minimize the loss. This program can include patrolling security guards, video cameras, and secured storage facilities.
- c. **Loss Reduction:** Loss reduction is a technique that not only accepts risks, but accepts the fact that loss might occur as a result of the risk. This technique will seek to minimize the loss in the event of some type of threat. For example, a company might need to store flammable

material in a warehouse. Company management realizes that this is a necessary risk and decides to install state-of-the-art water sprinklers in the warehouse. If a fire occurs, the amount of loss will be minimized.

- d. **Separation:** Separation is a risk management technique that involves dispersing key assets. This ensures that if something catastrophic occurs at one location, the impact to the business is limited to the assets only at that location. On the other hand, if all assets were at that location, then the business would face a much more serious challenge. An example of this is when a company utilizes a geographically diversified workforce.
- e. **Duplication:** Duplication is a risk management technique that essentially involves the creation of a backup plan. This is often necessary with technology. A failure with an information systems server should not bring the whole business to a halt. Instead, a backup or fail-over server should be readily available for access in the event that the primary server fails. Another example of duplication as a risk management technique is when a company makes use of disaster recovery service.
- f. **Diversification:** Diversification is a risk management technique that allocates business resources to create multiple lines of business that offer a variety of products and / or services in different industries. With diversification, a significant revenue loss from one line of business will not cause irreparable harm to the company's bottom line.

Risk management is a key component in any sound company strategy. It is necessary to ensure long term organization sustainability and profitability.

## 5. **Risk Management Organization Structure:**

Organizational structure is the framework that holds an organization together and defines the lines of authority within a company, nonprofit organization or governmental agency. A well defined organizational structure provides a clear path for risk assessment procedures. Before risk assessment teams can begin to work, each member of the team must have a good working understanding of how the company is organized. The organizational structure will show team members who is responsible for each area or operation being evaluated.

- a. **Traditional Structures:** Traditional organizational structures typically show clear lines of authority that emanate from a central manager at the top of the organization. The authority vested in each department is clearly defined by its place within the organizational structure. Risk assessment operations can become bogged down when assessment operations are required to strictly follow established lines of authority in the company. The management of risks that cross these established lines can become a complicated process requiring intervention from the senior leadership.

b. Modern Structures: Modern organizational structures are arranged around teams, organizational processes, organizational functions and virtual operations. These types of organizational structures allow companies greater flexibility to react and adjust to changing market conditions and advancing technology. Risk assessment teams may find modern organizational structures difficult to understand because there may not be clear lines of authority for reporting identified risks. In response to these changing business realities, many organizations are turning to enterprise risk management systems to evaluate and control risks. Effective Risk Management (ERM) helps management define how risk factors are interrelated in an organization.
